

0

A Knob with 'centered' orientation:

```
<body>
<div id="knobContainer2"></div>
<div id="value2">0</div>

<script>
var parameters2 = {
  containerId: 'knobContainer2',
  knobId: 'knob2',
  orientation: 'centered',
  max: 100,
  min: -100,
  xAxis: false,
  onLeftTurn: function(value) {
    document.getElementById('value2').innerHTML = value;
  },
  onRightTurn: function() {
    document.getElementById('value2').innerHTML = value;
  },
  onReset: function() {
    document.getElementById('value2').innerHTML = value;
  }
}
var knob2 = new Knob(parameters2);
</script>
</body>
```

This knob goes from -100 to 100, and our default value is 0. This time, our `xAxis` property is set to `false`, which means to control the knob, we now have to move the mouse up or down
